OCTOBER 1988 OKLAHOMA SUMMARY

Persistent northwesterly flow in the upper atmosphere over Oklahoma resulted in the 15th coolest and 26th driest October in the last 97 years. During most of the month an upper level high pressure ridge west of the State steered strong storm systems north of Oklahoma and suppressed development of the Pacific low and its delivery of moisture into the State. Most stations recorded more raindays than normal, but monthly precipitation totals were generally less than the long term average (see Table 1). In the absence of the heavy fall rainfall frequently associated with tropical systems, Oklahoma CD precipitation averages ranged from 36% to 77% of normal (see Map 1). Consequently, the portion of soil moisture supplies in the inadequate category rose from 15% to 55% during the month. The dry weather facilitated field work, however, and wheat seeding was 3 weeks ahead of the 5-year average. Progress of soybean and peanut harvesting approached normal by month's end.

A very strong upper level low moved over Oklahoma on October 1, delivering precipitation Statewide. A remarkable hail event occurred when severe thunderstorms in Grady and Stephens Counties produced hail accumulations one foot deep. The hail destroyed 150 acres of cotton in Stephens County.

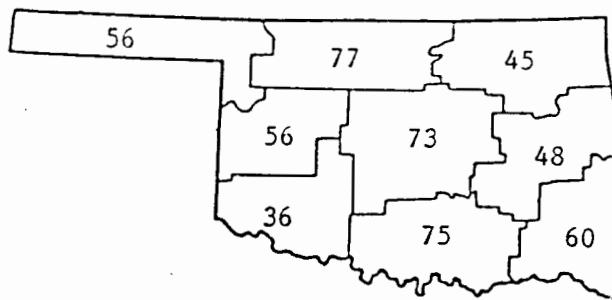

The development of a ridge following the frontal passage supported the flow of cooler air into the State. Temperatures ranged from 9 (SE) to 15 (NE) degrees below normal during the week ending October 9. Southerly surface winds eventually warmed the State and high temperatures reached the 80's by the middle of the month (16th-18th) when most stations recorded their highest readings. A cold air mass abruptly displaced the warmer air on the 18th and 19th and resulted in several 15 to 25 degree one-day drops in high temperatures.

Another frontal system during the last few days of the month delivered rainfall totals of over 1" to several stations in the southern one-third of the State and lesser amounts elsewhere. The northwestern one-third of Oklahoma reported the State's first fall frost when cooler air behind the front entered the area (see Table 2).

Table 1. Comparisons of October 1988 and long-term mean October number of raindays* and rainfall amounts for selected Oklahoma stations.

CD	Station	October 1988	Long-Term Mean	October 1988
		Raindays	October Raindays	Precipitation
1	Arnett	3	2	1.31
2	Perry	4	3	1.39
3	Bixby	3	3	1.12
4	Clinton	6	3	1.31
5	Oklahoma City	5	3	1.90
6	Eufaula	5	3	1.74
7	Altus Irr Sta	4	3	.90
8	Pauls Valley	5	4	2.29
9	Hugo	8	4	3.02

* For this study: days on which at least .10" of rain was recorded.

Map 1. Percent of Normal Precipitation by CD.
(October)

Table 2. October 1988 first freeze data. Six Oklahoma stations experienced freezing temperatures in October. Below is a list of the dates and temperatures of these frosts along with the long term mean first fall frost dates (where available).

CD	Station	First 1988		Long-Term Mean First Freeze Date
		Freeze Date	Temperature	
1	Buffalo	26	32	20
1	Gage	28	31	21
1	Goodwell	28	27	20
1	Guymon	29	31	NA
2	Freedom	28	31	NA
2	Waynoka	28	31	25

TABLE OF 1987/1988 COMPARISONS

Station	October Temperatures (F)		October Precipitation (in.)	
	1987	1988	1987	1988
Arnett	56.7	56.2	.374	1.310
Enid	59.5	58.6	.262	2.050
Mutual	57.1	56.8	*	1.300
Tulsa	59.0	59.1	1.352	1.434
Elk City	60.6	60.0	.191	.364
Oklahoma City	60.6	60.2	1.824	1.906
McAlester	60.2	61.5	2.531	1.733

EXTREMES

Variable	Station	Division	Observation	Date
Minimum temperature (F)	Boise City	1	10	20
Maximum temperature (F)	Mangum Res.	7	95	18
Maximum 24-hour precipitation	Hennepin	8	2.82"	1

FALL COLORS*

Color appears in leaves as trees prepare for winter dormancy. Shedding the leaves enables trees to conserve water during the relatively dry months of winter. Not only is there less precipitation during winter months, what little moisture is present is often frozen and thus not available for use by the tree. If leaves remained on most trees, ice formation resulting from freezing temperatures could rupture tender leaf tissue. Accumulations of ice and snow on leaves could snap over-burdened branches. By adopting the deciduous habit most broadleaf species have found an effective way to deal with winter's cold and ice.

As day length gradually shortens in the fall, color appears. Chlorophyll, the dominant green pigment which transforms sunlight, carbon dioxide and water into plant food, diminishes in the leaves at the end of the growing season. As the green fades, the yellow, orange and brown pigments already present are unmasked. If weather conditions are ideal - warm, sunny days and cool nights - red pigments develop in the foliage of some species. Frost, contrary to popular belief, ends rather than begins the formation of colorful pigments. The delayed frost this year is affording Oklahomans an extended opportunity to view nature's artwork. The technicolor finale of the growing season ends when the leaves fall, the pigments decompose, or both.

Fall color intensity varies dramatically from year to year, species to species, and individual to individual. Although the exact timing changes from year to year, the sequence of change, from species to species is fairly predictable. Sumac and black walnut are among the first to color, sugar maple and red oak change late in the sequence.

Like hair color in humans, leaf color can vary greatly from individual to individual, affected by a number of genetic and environmental factors. One thing is certain; the best way to select a tree at a nursery for your yard is to pick the colorful tree in the fall when others of its kind are changing. If you choose one that tends to color late, you could be stuck with a tree that may not color soon enough to avoid the killing frost.

Color descriptions are tricky. People see color differently and the terms we use to describe color are not precise, but there are reasonably accurate terms that permit us to describe color according to three of its measurable properties - hue, lightness and saturation. For example, crimson is often used to describe one variation in the fall color of white oak foliage. Crimson is not just a synonym of red. Crimson is defined as a dark (lightness), strong (saturation), red(hue). The word scarlet, often used to describe red oak leaves, is defined as a very bright (lightness), strong (saturation), red(hue). Admittedly, it is more fun to argue over the meaning of burnt orange and wine-colored than to describe colors as objectively as possible. Careful use of these terms makes descriptions of tree foliage a lot more meaningful.

*Adapted from "Tell Autumn Trees by Color", by Robert W. Fluchel,
Education Consultant, Missouri Conservationist, October, 1988.

OCTOBER 1988 DEVIATION FROM NORMAL TEMPERATURES

OCTOBER 1988 TOTAL HEATING DEGREE DAYS

OCTOBER 1988 DEVIATION FROM NORMAL HEATING DEGREE DAYS

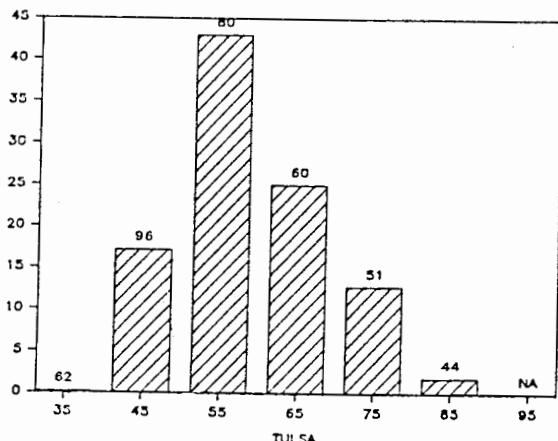

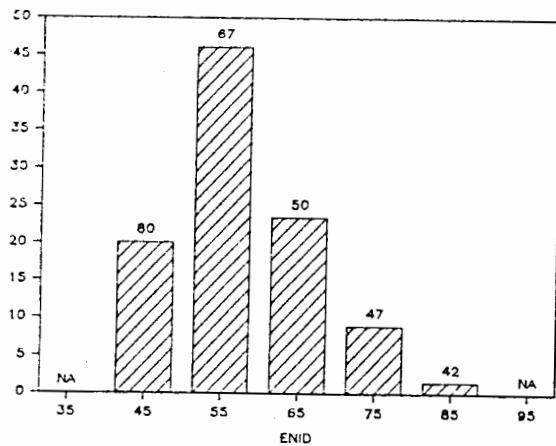

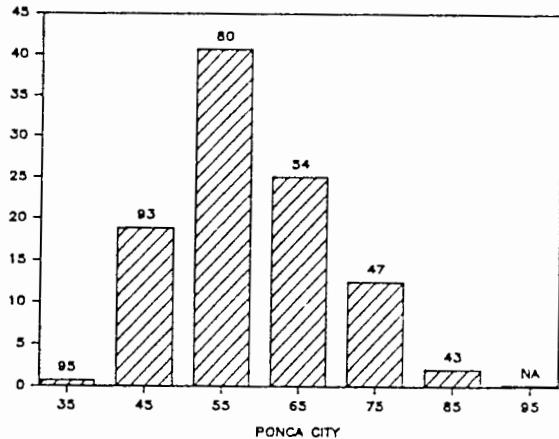

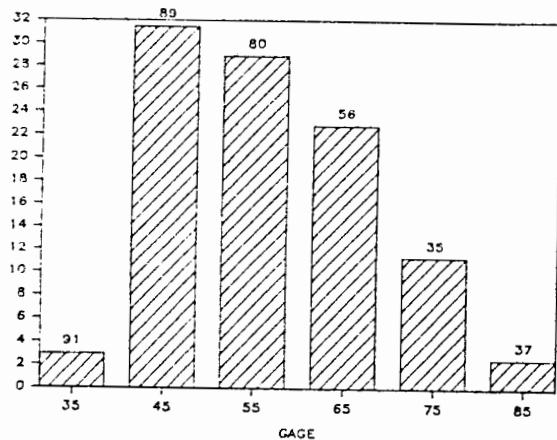

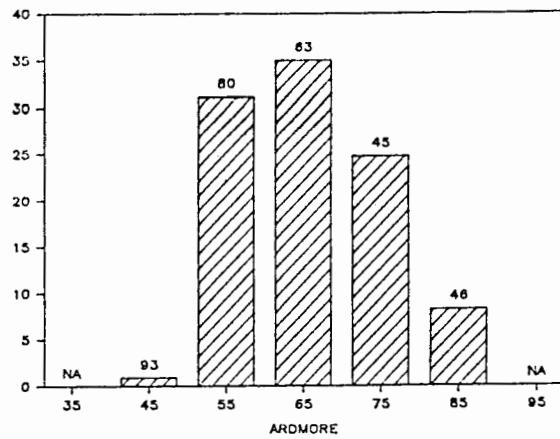

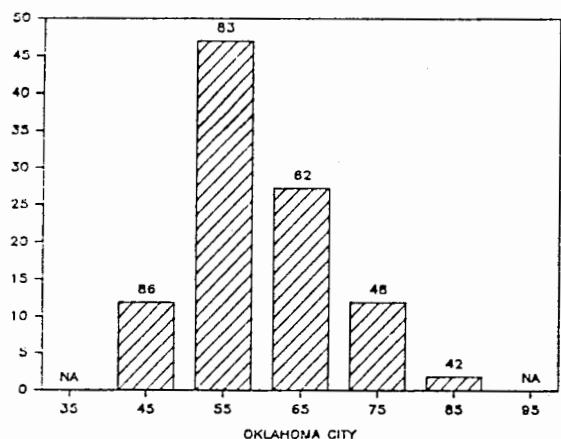

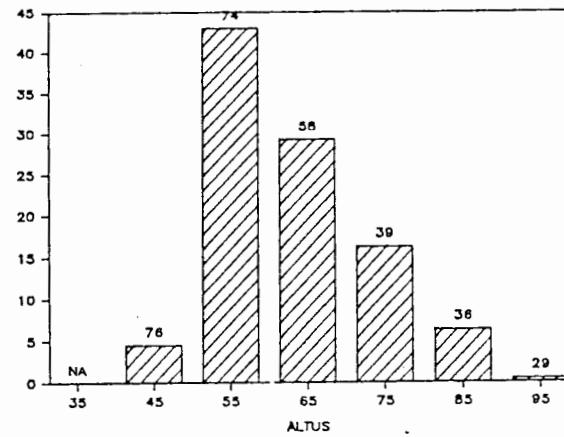

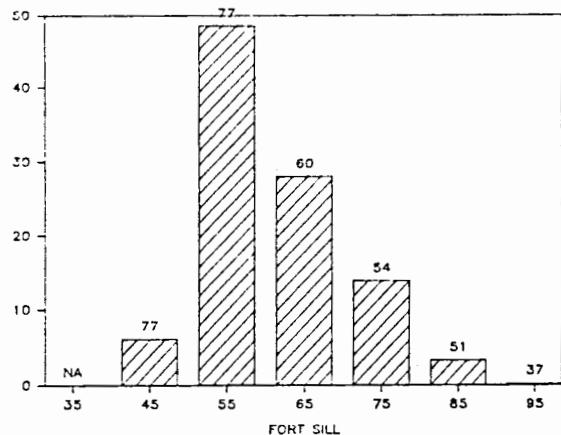

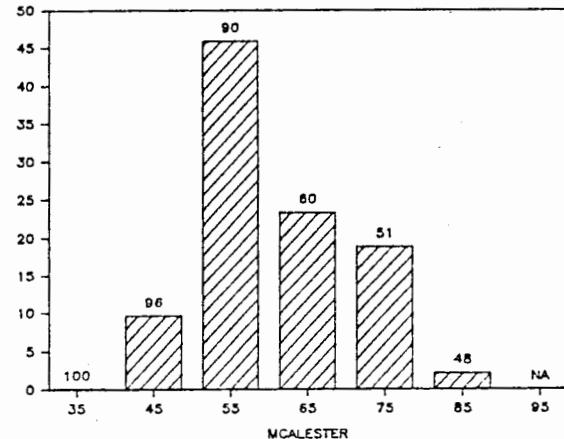

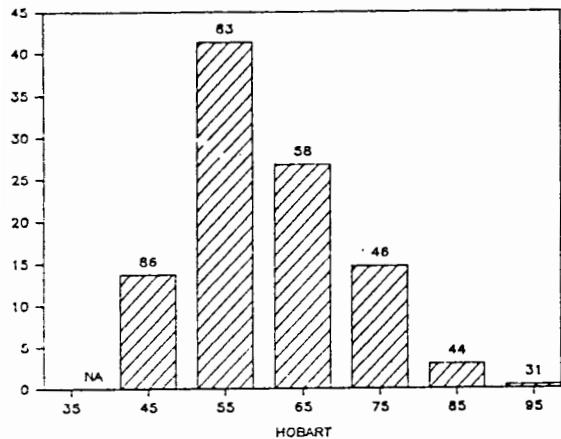

OCTOBER 1988 TOTAL PRECIPITATION
 (Inches)

OCTOBER 1988 DEVIATION FROM NORMAL PRECIPITATION

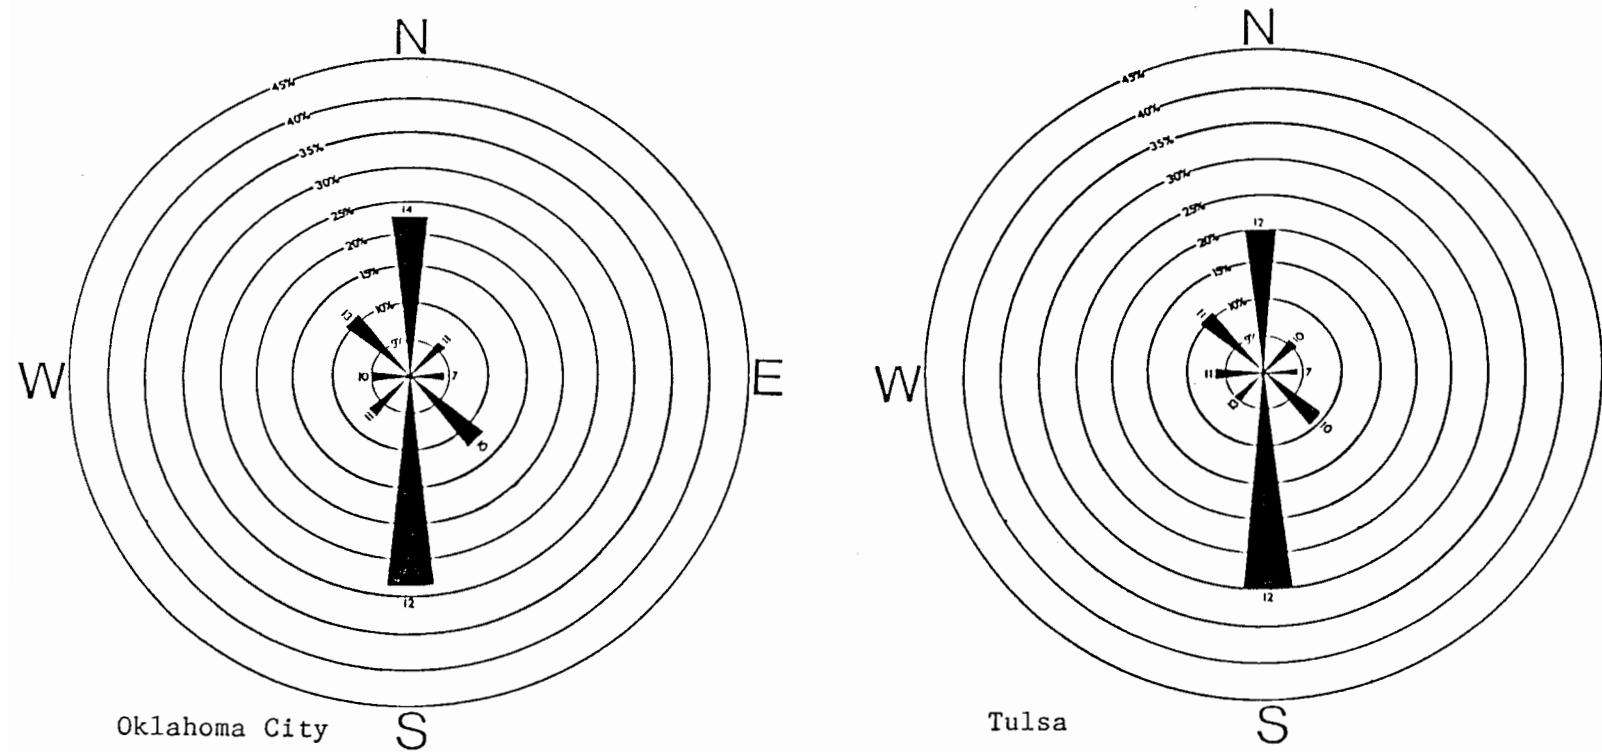

The following graphs present October 1988 hourly temperature and corresponding relative humidity information for 10 Oklahoma stations. The height of each bar represents the percentage of the hours in the month when the temperature was observed within the category given below the axis ($45 = 40$ to 49 , $55 = 50$ to 59 , etc.). The number above each bar is the median relative humidity associated with the temperature category below it.

Example: Approximately 27% of Oklahoma City's hourly temperature values ranged from 60 to 69 degrees. The median relative humidity associated with this temperature class was 62%.

December wind roses for Oklahoma City and Tulsa for 10-year (1965-1974) mean winds (data adapted from NOAA Airport Climatology Series). Percents represent the percentage of winds coming from a direction. The numbers at the end of the bars indicate the average speed (miles per hour) of winds from that direction.

- 2 - North Central
- 3 - Northeast
- 4 - West Central
- 5 - Central
- 6 - East Central
- 7 - Southwest
- 8 - South Central
- 9 - Southeast

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and summed. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$29 \sum_{i=1}^{65} ((TMAX_i + TMIN_i)/2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i)/2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

EXPLANATION OF MAPS

To give a Statewide perspective, a series of maps is produced each month from the information contained in the station tables. Each map is calculated using between 50 and 200 observations. Only stations with complete monthly records are used. Each observation is put into one of three categories and assigned a plus (+), minus (-), or a dot (.). The minus is the lowest numeric category, the dot is the middle and the plus the highest numeric category. If a map location has no report, a value is estimated. Each map is accompanied by its own legend. The categories will vary from month to month throughout the year. The categories for the deviations from normal maps will always remain constant. This is to facilitate comparisons between months and across years.

CLIMATE CALENDAR

The data on this calendar are for Oklahoma City.
 Normal values are calculated for the period
 1950-1979. Extremes are found for the period
 of record (1924-present).
