MONTHLY SUMMARY FOR OCTOBER 1992

Mild, dry autumn weather prevailed throughout Oklahoma during October. By month's end, a shortage of soil moisture was being felt in western Oklahoma, which also had received little rainfall in September. Precipitation for the month averaged 0.76 inch, statewide.

The scanty precipitation was 2.31 inches below normal for the month, making this the 11th driest October since 1892. The statewide precipitation for the year through the end of October is 32.19 inches, exceeding the 30-year normal by 2.04 inches. Temperatures for the month averaged 62.8 degrees, seven-tenths of a degree above normal. The average temperature for the year, thus far, is 63.6 degrees, one-tenth of a degree above the long term average.

Dry conditions were felt everywhere, but rainfall was particularly sparse in the west. The southwestern and west central climate divisions (CDs) each received less than 10% of normal October precipitation. The north central and northeastern CDs fared somewhat better, each receiving approximately 40% of normal precipitation for the month. Percent of normal values for the other five CDs ranged from 12% in the southeast to 37% in the central.

Bokchito reported 1.96 inches of rain on October 2nd, the only precipitation reported in the state during the first five days of the month. A cold front with strong support in the upper atmosphere crossed the state on the 7th, producing traces of sleet and snow in the Panhandle and heavy thunderstorms in central and eastern Oklahoma. Thunderstorm related winds in excess of 60 miles per hour were reported at several locations. A small tornado in eastern Canadian County destroyed six mobile homes in southwest Oklahoma City, injuring two. Several other mobile homes were damaged there and in Mustang. In eastern Oklahoma, high waves on Robert S. Kerr Reservoir sank a tugboat and two of the eight barges it was towing.

Carnegie and Hooker each reported a low temperature of 30 degrees on the 8th, the first freezing temperatures observed in the state this autumn. The cold air moderated fairly rapidly under sunny skies which prevailed over the next several days. Buffalo reported the state's high temperature for the month, 99 degrees, on the 13th. Strong winds exacerbated the drying trend and Oklahoma City instituted a ban on outside burning.

Large hail was reported on the 15th in several counties in south central Oklahoma. The hail-producing thunderstorms developed ahead of a cold front that brought little precipitation but did lead to the month's lowest reported temperatures, 24 degrees at Gage on the 17th and at Freedom on the 17th and 18th.

Another cold front crossed the state on the 24th and early on the 25th. Precipitation, generally less than one-half inch, was reported in the eastern half of the state. A stronger system entered the state on the 28th, stalled in its southern movement and affected the state's weather through the end of the month. Several locations reported over one inch of rain on the 28th, 29th and 31st. Power lines were knocked down in Canadian County on the 28th. Large hail and damaging winds were reported in eastern Oklahoma on the afternoon of the 31st. The roof of a school in Quinton was damaged by 65 mile per hour winds. Later on Halloween night, winds of up to 63 miles per hour were reported with a line of thunderstorms that passed through the Oklahoma City metropolitan area. Thunderstorms were accompanied by strong winds over many areas in eastern and southern Oklahoma, including thunderstorm winds of 70 miles per hour reported at Wagoner.

- 4 - West Central
- 5 - Central
- 6 - East Central
- 7 - Southwest
- 8 - South Central
- 9 - Southeast

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and summed. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and summed. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i)/2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

The data on this calendar are for Oklahoma City
 Normal values are calculated for the period
 1961-1990. Extremes are found for the period
 of record (1891-present).
